

How To Run Project

First to connect the backend we have to run the following command.

```
cd backend
```

```
nodemon index.js
```

Then to run the app we have to run the following command in main folder.

```
npm run dev
```

Then the app will be running on browser

You can create an account on the application using username, email id, password and location.

You can login using the email id and password you used while creating the account.

After logging in, you will land on the home page where you can find different dishes.

Click on Add to cart button to put any particular dish in the cart.

Then click on check out button then the food dishes can be seen in my orders.

The data of food dishes you have ordered will be added in the backend.

Tech stack:

React.js & React Bootstrap for Frontend,

Nodejs, Express.js for Backend

MongoDB for Database

Vite as build tool.
